

Introduction to Virtual/Augmented Reality and Telepresence

Assignment 3 Augmented Reality Museum

Using Unity 3D, I would like you to create a museum AR application that contains two laser-scanned objects. To develop the AR application, we will use Google [ARCore](#) for Android or iOS using the Unity [XR plug-in framework](#). The main idea is to create the ability to hold a museum object in your hand. Then, you should change the objects with a click and add sound and text to describe the object selected.

Source of museum artefacts are located at [Museum-Objects.rar](#)

Pictures:

Once the museum model is ready, I would you to prepare a Unity executable for an android phone.

The making will be based on the following:

- The functionality of the game is 70%
- Additional features: Visual Quality 10% Display speed optimization using scene graph and LOD 30%

Send the working game (as a video capture) and a link to the Unity 3D project at VRARM806.2026@gmail.com on December 1.
